                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                JATELES STRUCT. Biol. 6:691-696 (1999).
-!- FUNCTION: CAN EFFICIENTLY HYDROLYZE NONSTANDARD NUCLEOTIDES SUCH
AS XTP TO XMP OR ITP TO IMP, BUT NOT THE STANDARD NUCLEOTIDES. XTP
IS THE BEST SUBSTRATE.
-!- CATALYTIC ACTIVITY: NTP + H(2)O = NDP + phosphate.
-!- COFACTOR: Magnesium or manganese.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SEQUENCE FROM N.A.

                                                                                                                                                                                                                                                                                                                                                                          -!- FUNCTION: APPEARS TO BE THE POSITIVE ACTIVATOR OF UHPT TRANSCRIPTION.
-!- SUBCELLULAR LOCATION: Cytoplasmic (Probable).
-!- PTM: PHOSPHORYLATED BY UHPB (PROBABLE).
-!- PTM: PHOSPHORYLATED BY UHPB (PROBABLE).
-!- SIMILARITY: Contains 1 response regulatory domain.
-!- SIMILARITY: BELONGS TO THE LUXR/UHPR FAMILY OF TRANSCRIPTIONAL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Eukaryota, Metazoa, Chordata, Craniata, Vertebrata, Euteleostomi,

-- CATALYITC ACTIVITY: CYtidine + H(2)0 = uridine + NH(3).
-- COPACTOR: Zinc (By similarity)
--- SIMILARITY: Belongs to the cytidine and deoxycytidylate deaminases
                                                        J. Biol. Chem. 274:18470-18476(1999).
--- FUNCTION: RNA-editing deaminase involved in somatic hypermutation, gene conversion, and Class-switch recombination. Required for several crucial steps of B-cell terminal differentiation necessary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SEQUENCE FROM N.A.

DISEASE: Defects in RBD4 are a cause of retinol-binding protein DISEASE: Defects in RBD4 are a cause of retinol-binding protein deficiency [MIM:180250]. This condition causes night vision problems. It produces a typical "fundus xerophthalmicus," featuring a progressed atrophy of the retinal pigment epithelium. DISEASE: A deficiency of vitamin A blocks secretion of the binding protein posttranslationally and results in defective delivery and supply of vitamin to the epidermal cells (a condition associated with a dermatosis).

Tetinol-binding proceins.

I J. Biol. Chem. 260:6422-6480 (1985).

- I- FUNCTION: Delivers retinol from the liver stores to the peripheral tissues. In plasma, the RBP-retinol complex interacts with transthyretin, this prevents its loss by filtration through the kidney glomeruli.

C - SUBCELLULAR LOCATION: Secreted.

- SUBCELLULAR LOCATION: Secreted.

- SUBCELLULAR LOCATION: Correted.

E -> K (IN REF. 1).
A -> V (IN REF. 1).
A -> GS (IN REF. 1).
N -> H (IN REF. 1).
-!- FUNCTION: Allows the bacteria to use the host heme as an iron source. Involved in the oxidation of heme and subsequent release of iron from the heme moiety.
-!- CATALYTIC ACTIVITY: Heme + 3 AH(2) + 0(2) = biliverdin + Fe(2+) + CO + 3 A + 3 H(2)0.
-!- SIMILARITY: Belongs to the heme oxygenase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Viruses; BRNA positive-strand viruses, no DNA stage; Bromoviridae;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      "The sequence of the Orgyia pseudoteugata multinucleocapsid nuclear polyhedrosis virus genome."; 
Virology 229:1381-399(1997).
-!- FUNCTION: COULD BE INACTIVE AS THE ACTIVE SITE CYSTEINE IS MODIFIED TO TRYPTOPHAN.
-!- CATALYTIC ACTIVITY: Protein tyrosine phosphate + H(2)0 = protein tyrosine + phosphate.
-!- SIMILARITY: BELONGS TO THE NON-RECEPTOR CLASS OF THE PROTEIN-TYROSINE PHOSPHATASE FAMILY. CDC14 SUBFAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gape

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Flant Moi. Biol. Rep. 13:333-335 (1995).
-!- SUBDUAT: Part of the 30S ribosomal subunit.
-! SUBCELLULAR LOCATION: Chloroplast.
-!- SUBLIARITY: Belongs to the 33P family of ribosomal proteins.
-!- SIMILARITY: Contains 1 KH type-2 domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                               s-adenosyl-L-homocysteine + menaquinol.
-!- PATHWAY: Menaquinone biosynthesis; last step.
-!- SIMILARITY: Belongs to the ubiE family.
                                                                                                                                                                                                             [1]
